INTRODUCTION

Julian Shaw

Technology Leader &
Software Architect

March 2026

Why I'm Here

You need a platform built
— one that is legally defensible,
auditable, and scalable.

I've been asked to present how I'd approach that — and what role I could play in making it happen.

The Problem: Tungsten Supply Chains Are Legally Exposed

OPAQUE

Multi-tier chains with no single source of truth

DFARS

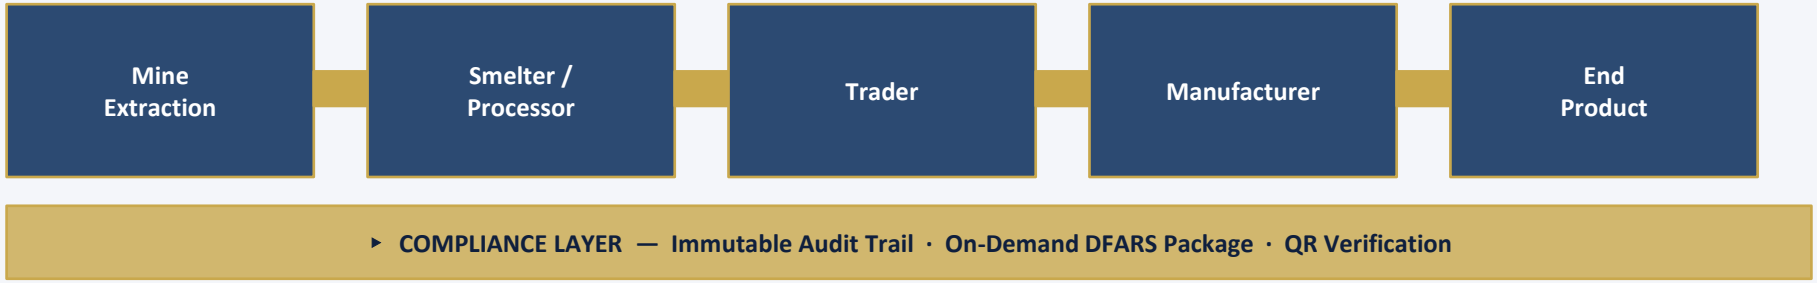
Federal obligation to verify conflict-free sourcing

MANUAL

Documentation is fragmented & not independently verifiable

The risk is not theoretical — a failure to produce a defensible compliance package on demand exposes manufacturers to contract loss, debarment, and reputational damage. The platform solves this permanently.

The Technical Challenge: What This Platform Must Do



Custody Tracking

Every event logged — from mine to manufacturer — with immutable timestamps

Compliance Engine

DFARS/CMMC/ITAR rules enforced at submission, not discovered in audit

Integrations

Labs, customs, RMAP, IoT — with defined failure behaviour & fallback states

Audit Dossier

Full compliance package retrievable in ≤4 business hours by any authorised party

My Relevant Experience

Engineering Rigour

Built testable, uniquely-identified requirements from scratch. Zero ambiguity before build begins.

Systems Integration

Defined versioned API contracts with explicit failure modes and fallback states.

Governance & Audit

Designed for external auditor verification — dossiers, evidence chains, role ownership.

Security & Compliance

Delivered regulated systems with immutable audit trails and infrastructure-level enforcement.

Cloud Architecture

Azure SaaS platforms at scale — multi-tenant, phased delivery, SLA-governed.

Startup Leadership

Personal ownership of technical decisions — not a delegator — with cross-functional domain literacy.

How I Would Approach This Build

01

Spec Quality Before Code

Every requirement gets a unique FR-XXX identifier linked to a test case. Ambiguity is caught in planning — not in QA or a regulatory audit.

02

Compliance Baked In

DFARS, CMMC 2.0, ITAR rules enforced at the data layer. Not bolted on as reporting.

03

Phase 1 Exit is Non-Negotiable

Three live suppliers, verified DFARS Declaration Package, all mandatory event fields validated at submission.

04

Build for the Auditor

Every design decision tested against: 'Can an external auditor independently verify this within 4 business hours?'

Azure SaaS · Phased Delivery (Phase 1 → Phase 2) · Spec-driven Engineering

How I See My Role

OPTION A

Technical Lead & Platform Architect

- Own the technical delivery end-to-end
- Spec quality, architecture, integration contracts
- Phase 1 and Phase 2 build accountability
- Report to board on RA-XX resolution & phase exit criteria

OPTION B

CTO — Broader Technology Leadership

- All of Option A, plus organisational scope
- Cross-functional literacy: DFARS, OECD, RMAP, supply chain
- Build the team; own security, compliance, and governance pillars
- Right fit depends on team structure & board expectations — open discussion

"My decision will be informed by this conversation — I'm looking for the right fit, not just a title."

QUESTIONS & NEXT STEPS

Let's have the right conversation

"What does Phase 1 success look like to you?"

Helps me calibrate delivery priorities and board expectations.

"Is the spec ready to build from — or does it need a review cycle first?"

v2.3 is still DRAFT. The answer shapes the first 60 days significantly.

"Who are the key stakeholders I'd be working with day-to-day?"

Team structure will inform whether Option A or Option B is the right engagement.
